

UVMAP Example Cases

Data files for several *UVMAP* example cases are provided. Package archives with all of the example cases are provided in [uvmap-examples.tar.gz](#) (tar-gzip archive for Linux/MacOSX) and [uvmap-examples.zip](#) (zip archive for Windows). Copy the package archive files and unpack them in a location of your choosing to run the example cases. All cases require minimal resources. The 3D input tria-face surface mesh files, case##.surf, provided for the example cases are ASCII formatted files of SURF type. The demonstration program *UVMAP* will generate UV mapping and output to a file of the same type. The output file, case##_uv.surf will contain U,V coordinates in place of the X,Y coordinates and a 0 for the Z coordinate. A log file containing all of the progress output can optionally be generated. The log file, case##_uvmap.log, is an ASCII formatted text file. A UV mapping can be generated for any of the example cases using the following command.

```
uvmap case_name
```

See [UVMAP overview](#) for information on available options and usage. Alternatively, you can view text-based documentation at the command line with any of the following commands.

```
uvmap
uvmap -h
uvmap -help
```

The *UGC* program is provided with the [UG IO library](#) and can convert the output UV mesh file into various alternative output file types. Several *UVMAP* example case files named case##.surf are provided. Shown for each is an image of the X,Y,Z physical space input surface mesh and of the generated U,V mapping space.
